

# **Assignment-6.4**

## **Task-01: Task 1: Student Performance Evaluation System**

**Scenario** You are building a simple academic management module for a university system where student performance needs to be evaluated automatically.

**Task Description** Create the skeleton of a Python class named **Student** with the attributes:

- **name**
- **roll\_number**
- **marks**

**Write only the class definition and attribute initialization.**

**Then, using GitHub Copilot, prompt the tool to complete:**

- A method to display student details
- A method that checks whether the student's marks are above the class average and returns an appropriate message

**Use comments or partial method names to guide Copilot for code completion.**

## **Expected Outcome**

- A completed **Student** class with Copilot-generated methods
- Proper use of:
  - **self attributes**
  - **Conditional statements (if-else)**
- Sample output showing student details and performance status

```

1 Task1.py > ...
2 """
3 University Performance System - Student Class
4 """
5
6 class Student:
7     """Student class to manage student information and performance tracking."""
8
9     # Class variable for class average
10    class_average = 75
11
12    def __init__(self, name, roll_number, marks):
13        """
14            Initialize student with name, roll_number, and marks.
15
16            Args:
17                name (str): Student's name
18                roll_number (int): Student's roll number
19                marks (float): Student's marks
20
21            self.name = name
22            self.roll_number = roll_number
23            self.marks = marks
24
25    def display_student_details(self):
26        """Display student information - name, roll_number, and marks."""
27        # TODO: Print student details in a formatted way
28        print(f"Student Name: {self.name}")
29        print(f"Roll Number: {self.roll_number}")
30        print(f"Marks: {self.marks}")
31
32    def check_performance_status(self):
33        """Check if student's marks are above class average using if-else statement."""
34        # TODO: Compare self.marks with class_average and return performance status
35        if self.marks > self.class_average:
36            status = "Above Average"
37        else:
38            status = "Below Average"
39        return status
40
41    def is_above_average(self):
42        """Return True if marks are above class average, False otherwise."""
43        if self.marks > self.class_average:
44            return True
45        else:
46            return False

```

← PYTHON STUDENT CLASS FOR UNIVERSITY PERFORMANCE... □

Create a Python Student class for a university performance system with name, roll\_number, and marks initialized in `__init__`, then use comments or partial method names to guide Copilot to generate one method to display student details and another method that checks if the student's marks are above the class average using `if` and `else`, include a small demo creating a student object, printing details, checking performance status, and show sample output.

✓ Read Python file

Now I'll create the Student class with detailed comments to guide method generation and include a demo with sample output:

✓ Created • Task1.py

Now let me run the demo to show you the sample output:

Run `push` command?

`python Task1.py`

Allow ▾ Skip

Ø | + Task1.py

Describe what to build next

Agent ▾ Auto ▾ ⚙

## OUTPUT:

```

Is Above Average: False

--- Student 3 Details ---
Student Name: Carol Davis
Roll Number: 103
Marks: 75
Performance Status: Above Average
Is Above Average: False

=====
Class Average: 75
=====
PS C:\Users\tloke\OneDrive\AI>

```

## Task-02: Task 2: Data Processing in a Monitoring System

### Scenario

You are working on a basic data monitoring script where sensor readings are collected as numbers. Only even readings need further processing.

### Task Description

Write the initial part of a for loop to iterate over a list of integers representing sensor readings.

Add a comment prompt instructing GitHub Copilot to: • Identify even numbers • Calculate their square

- Print the result in a readable format

Allow Copilot to complete the remaining loop logic.

### Expected Outcome

- A complete for loop generated by Copilot

- Use of:

- Modulus operator to identify even numbers

- Conditional statements

- Correct and formatted output for valid inputs

The screenshot shows the Python Student Class interface. On the left, the code editor displays `Task2.py` with the following content:

```

1  """
2 Sensor Reading Analysis System
3 Process sensor readings to identify and analyze even numbers
4 """
5
6 # Sample sensor readings data
7 sensor_readings = [12, 7, 24, 15, 8, 3, 36, 11, 20, 5]
8
9 print("-" * 60)
10 print("SENSOR READINGS ANALYSIS - EVEN NUMBERS AND THEIR SQUARES")
11 print("-" * 60)
12 print(f"\nOriginal Sensor Readings: {sensor_readings}\n")
13
14 # Start iterating over the list of sensor readings
15 for reading in sensor_readings:
16     # Check if the reading is an even number using modulus operator (%)
17     # If reading % 2 equals 0, the number is even
18     if reading % 2 == 0:
19         # Calculate the square of the even number
20         square = reading * reading
21         # Print the result in a readable format with clear information
22         print(f"Reading: {reading:3d} | Even Number | Square: {square:4d}")
23         # If the number is odd (not even), indicate it in the output
24     else:
25         print(f"Reading: {reading:3d} | Odd Number | Skipped")
26
27 print("\n" + "=" * 60)
28 print("Analysis Complete!")
29 print("-" * 60)
30
31 # Additional demonstration: List comprehension alternative
32 print("\n--- Alternative: Extract even numbers using list comprehension ---")
33 even_readings = [r for r in sensor_readings if r % 2 == 0]
34 even_squares = [r * r for r in even_readings]
35 print(f"Even Numbers: {even_readings}")
36 print(f"Their Squares: {even_squares}")
37

```

On the right, the task card provides instructions and key features:

**PYTHON STUDENT CLASS FOR UNIVERSITY PERFORMANCE...**

Write the initial part of a for loop to iterate over a list of integer sensor readings, then add clear comments to guide Copilot to identify even numbers using the modulus operator (%), calculate their square, and print the result in a readable format using if conditions, allowing Copilot to complete the remaining loop logic and generate the full working code with correct formatted output.

✓ Read Python file  
Now I'll create the file with a for loop structure and clear comments to guide Copilot in generating the full logic.

✓ Created `Task2.py`  
Perfect! I've created a comprehensive sensor reading analysis script with:

**Key Features:**

- For loop structure iterating over a list of sensor readings (12, 7, 24, 15, 8, 3, 36, 11, 20, 5)
- Clear comments guiding Copilot to:
  - Use the modulus operator (%) to identify even numbers
  - Calculate square using multiplication
  - Apply if-else conditions for even/odd classification
- Formatted output with aligned columns showing:
  - Reading value
  - Classification (Even/Odd)
  - Square value (for even numbers only)
- Complete working code that processes all sensor readings
- Bonus section showing a list comprehension alternative

The code demonstrates proper formatting with readable output and includes comments at each step to guide code generation logic. The output will show which readings are even numbers and their respective squares.

Describe what to build next

Agent Auto

## **OUTPUT:**

```
SENSOR READINGS ANALYSIS - EVEN NUMBERS AND THEIR SQUARES
=====
Original Sensor Readings: [12, 7, 24, 15, 8, 3, 36, 11, 20, 5]

Reading: 12 | Even Number | Square: 144
Reading: 7 | Odd Number | Skipped
Reading: 24 | Even Number | Square: 576
Reading: 15 | Odd Number | Skipped
Reading: 8 | Even Number | Square: 64
Reading: 3 | Odd Number | Skipped
Reading: 36 | Even Number | Square: 1296
Reading: 11 | Odd Number | Skipped
Reading: 20 | Even Number | Square: 400
Reading: 5 | Odd Number | Skipped

=====
Analysis Complete!
=====

--- Alternative: Extract even numbers using list comprehension ---
Even Numbers: [12, 24, 8, 36, 20]
Their Squares: [144, 576, 64, 1296, 400]

```

## **Task-03: Task 3: Banking Transaction Simulation**

### **Scenario**

**You are developing a basic banking module that handles deposits and withdrawals for customers.**

### **Task Description**

**Create the structure of a Python class named BankAccount with attributes:**

- account\_holder
- balance

**Use GitHub Copilot to complete methods for:**

- Depositing money
- Withdrawing money
- Preventing withdrawals when the balance is insufficient

**Guide Copilot using method names and short comments.**

### **Expected Outcome**

- A fully functional BankAccount class

- Copilot-generated methods using:
  - if-else conditions
  - Class attributes via self
- Proper handling of invalid withdrawal attempts with user-friendly

## Messages

The screenshot shows the Python Student Class interface. On the left, the code for `Task3.py` is displayed:

```

1  """
2  Banking System - BankAccount Class
3  A simple yet functional banking simulation system
4  """
5
6  class BankAccount:
7      """Class to manage bank account operations including deposits, withdrawals, and balance tracking."""
8
9      def __init__(self, account_holder, initial_balance):
10         """
11             Initialize bank account with account holder name and initial balance,
12
13             Args:
14                 account_holder (str): Name of the account holder
15                 initial_balance (float): Initial balance in the account
16
17             self.account_holder = account_holder
18             self.balance = initial_balance
19
20     def deposit_money(self, amount):
21         """
22             Deposit money into the account.
23             Add the deposit amount to self.balance and display confirmation message.
24
25             # Check if the deposit amount is valid (positive number)
26             if amount > 0:
27                 self.balance += amount
28                 print(f"✓ Deposit Successful!")
29                 print(f" Amount Deposited: ${amount:.2f}")
30                 print(f" New Balance: ${self.balance:.2f}")
31             else:
32                 print("X Invalid Deposit Amount: Amount must be greater than zero.")
33
34     def withdraw_money(self, amount):
35         """
36             Withdraw money from the account.
37             Use if-else to check if sufficient balance exists before allowing withdrawal.
38
39             # Check if withdrawal amount is valid
40             if amount < 0:
41                 print("X Invalid Withdrawal Amount: Amount must be greater than zero.")
42             # Check if account has sufficient balance for the withdrawal
43             elif amount > self.balance:
44                 print("X Insufficient Balance Error!")
45                 print(f" Requested Amount: ${amount:.2f}")

```

On the right, the generated documentation is shown:

**PYTHON STUDENT CLASS FOR UNIVERSITY PERFORMANCE...**

Create a Python class called `BankAccount` with attributes `account_holder` and `balance` initialized in `__init__`, then use method names and short comments to guide Copilot to generate methods for depositing money, withdrawing money, and preventing withdrawals when the balance is insufficient using self and if-else conditions, with user-friendly messages for invalid withdrawal attempts and a fully functional banking simulation.

✓ Created and read `Task3.py` file  
Created a comprehensive `BankAccount` class with:

**Key Features:**

- **Class Attributes:** `account_holder` and `balance` initialized in `__init__`
- **Three Core Methods:**
  1. `deposit_money()` - Adds funds to the account with validation
  2. `withdraw_money()` - Withdraws funds with multiple if-else conditions:
    - Checks for valid withdrawal amount
    - Validates sufficient balance before withdrawal
    - Prevents withdrawal if insufficient funds
  3. `check_balance()` and `display_account_info()` - Helper methods
- **User-Friendly Messages:**
  - Success indicators (✓) for valid operations
  - Error indicators (X) for invalid operations
  - Clear error messages showing requested amount vs. available balance
  - Shortage amount display for insufficient balance attempts
- **Fully Functional Banking Simulation** demonstrating:
  - Creating accounts with initial balances
  - Multiple deposits and withdrawals

## Task-04:

### Task 4: Student Scholarship Eligibility Check

#### Scenario

A university wants to identify students eligible for a merit-based scholarship based on their scores.

#### Task Description

Define a list of dictionaries where each dictionary represents a student

with:

- name
- score

Write the initialization and list structure yourself.

Then, prompt GitHub Copilot to generate a while loop that:

- Iterates through the list
- Prints the names of students who scored more than 75

Use comments to guide Copilot's code completion.

#### Expected Outcome

- A complete while loop generated by Copilot
- Correct index handling and condition checks
- Cleanly formatted output listing eligible students

The screenshot shows the GitHub Copilot interface with the following details:

- Task Description:** Define a Python list of dictionaries where each dictionary stores a student's name and score, then use clear comments to guide Copilot to generate a while loop that iterates through the list using proper index handling, checks which students scored more than 75 using conditional statements, and prints the eligible student names in a clean, readable format.
- Code Generated:**

```
task4.py > ...
1  """
2  Student Score Analysis System
3  Use while loops to identify and display students who scored above 75
4  """
5
6  # Define a list of dictionaries containing student information
7  # Each dictionary has 'name' and 'score' keys
8  students = [
9      {"name": "Alice Johnson", "score": 78},
10     {"name": "Bob Smith", "score": 65},
11     {"name": "Carol Davis", "score": 82},
12     {"name": "David Wilson", "score": 72},
13     {"name": "Emma Brown", "score": 88},
14     {"name": "Frank Miller", "score": 91},
15     {"name": "Grace Lee", "score": 70},
16     {"name": "Henry Taylor", "score": 79},
17     {"name": "Ivy Martinez", "score": 55},
18     {"name": "Jack Anderson", "score": 85}
19 ]
20
21 print("-" * 70)
22 print("STUDENT SCORE ANALYSIS - ELIGIBILITY CHECK (Score > 75)")
23 print("-" * 70)
24
25 print(f"\nTotal Students: {len(students)}\n")
26
27 # Initialize counter for proper index handling in while loop
28 index = 0
29
30 # Use a while loop to iterate through the list of students
31 # Continue looping while index is within the range of the list
32 while index < len(students):
33     # Get the current student dictionary from the list
34     student = students[index]
35
36     # Extract the student's name and score from the dictionary
37     name = student["name"]
38     score = student["score"]
39
40     # Check if the student's score is greater than 75 (eligibility criteria)
41     if score > 75:
42         # Print the eligible student's name and score in a clean, readable format
43         print(f"✓ {name}: Score: {score} [ELIGIBLE]")
44     else:
45         # Print non-eligible students for comparison
```
- Key Features:**
  - List of Dictionaries: 10 students with `name` and `score` keys
  - Clear Comments: guiding Copilot to:
    - Initialize index counter for proper while loop handling
    - Access dictionary values using key references
    - Check eligibility condition (`score > 75`)
    - Print formatted output
  - While Loop Implementation:
    - Proper index handling with initialization
    - Length-based loop condition check
    - Index increment at each iteration
    - Safe dictionary access within the loop
  - Conditional Statements:
    - If-else to check if `score > 75`
    - Separate formatting for eligible vs. non-eligible students
    - Visual indicators (✓ and X) for clarity
  - Clean, Readable Output:
    - Formatted table with aligned columns
    - Student names padded to 20 characters
    - Score displayed as 3-digit numbers
    - Clear [ELIGIBLE] / [NOT ELIGIBLE] labels
  - Additional Analytics: Agent, Auto, Go Live, etc.
- Bottom Status Bar:** Ln 85, Col 1 | Spaces: 4 | UTF-8 | CR LF | Python | 3.14.2 | Go Live |

## **OUTPUT:**

## **Task-05: Task 5: Online Shopping Cart Module**

### **Scenario**

**You are designing a simplified shopping cart system for an e-commerce website that supports item management and discount calculation.**

### **Task Description**

**Begin writing a Python class named ShoppingCart with:**

- An empty list to store items (each item may include name, price, quantity)**

**Use GitHub Copilot to generate methods that:**

- Add items to the cart**
- Remove items from the cart**
- Calculate the total bill using a loop**
- Apply conditional discounts (e.g., discount if total exceeds a certain amount)**

**Use meaningful comments and method names to guide Copilot.**

### **Expected Outcome**

- A fully implemented ShoppingCart class**

- Copilot-generated loops and conditional logic
  - Correct handling of item addition, removal, and discount calculation
  - Sample input/output demonstrating cart functionality

The screenshot shows a Jupyter Notebook interface with several tabs at the top: Task1.py, Task2.py, Task3.py, Task4.py, and Task5.py (the active tab). The code in Task5.py is as follows:

```
1 """
2     E-Commerce Shopping Cart System
3     Complete shopping cart with item management, billing, and discount functionality
4 """
5
6 class ShoppingCart:
7     """Shopping cart class to manage items, calculate totals, and apply discounts."""
8
9     # Discount thresholds
10    DISCOUNT_THRESHOLD_1 = 100 # 5% discount for orders > $100
11    DISCOUNT_THRESHOLD_2 = 250 # 10% discount for orders > $250
12    DISCOUNT_THRESHOLD_3 = 500 # 15% discount for orders > $500
13
14    def __init__(self, customer_name=""):
15        """
16            Initialize shopping cart with customer name and empty items list.
17
18            Args:
19                customer_name (str): Name of the customer
20            """
21        self.customer_name = customer_name
22        self.items = [] # Empty list to store items as dictionaries
23
24    def add_item(self, name, price, quantity):
25        """
26            Add an item to the shopping cart.
27            Store item as a dictionary with name, price, and quantity keys.
28            Check if item already exists and update quantity if it does.
29            """
30        # Check if item already exists in the cart
31        item_found = False
32        for item in self.items:
33            if item["name"].lower() == name.lower():
34                # Item exists, update the quantity
35                item["quantity"] += quantity
36                item_found = True
37                print(f"✓ Updated '{name}' quantity to {item['quantity']}")
38                break
39
40        # If item doesn't exist, add it as a new item
41        if not item_found:
42            new_item = {
43                "name": name,
44                "price": price,
45                "quantity": quantity
46            }
47            self.items.append(new_item)
48
49
50    def calculate_subtotal(self):
51        subtotal = sum(item["price"] * item["quantity"] for item in self.items)
52        return subtotal
53
54    def apply_discount(self):
55        total_bill = self.calculate_subtotal()
56        if total_bill > self.DISCOUNT_THRESHOLD_1:
57            discount = total_bill * 0.05
58        elif total_bill > self.DISCOUNT_THRESHOLD_2:
59            discount = total_bill * 0.10
60        elif total_bill > self.DISCOUNT_THRESHOLD_3:
61            discount = total_bill * 0.15
62        else:
63            discount = 0
64        final_total = total_bill - discount
65        return final_total
66
67    def calculate_total_bill(self):
68        subtotal = self.calculate_subtotal()
69        discount = self.apply_discount()
70        tax = subtotal * 0.08
71        final_total = subtotal + discount + tax
72        return final_total
73
74    def display_cart(self):
75        print("Cart Items:")
76        for item in self.items:

The right side of the interface shows a Chat window titled "PYTHON STUDENT CLASS FOR UNIVERSITY PERFORMANCE..." with a message from "CHAT" asking to start a ShoppingCart class. Below the code, there's a note about creating Task5.py file and a key features section.

## OUTPUT:

```
